

✦ KawaiiWorlds

One Minecraft server, many separate worlds — create, visit, and rule each one from a single click-to-use menu.

TL;DR — in one breath

A server-admin tool that lets one Minecraft server hold many different worlds at once. Spin up a flat world, a floating skyblock island, or an empty void in seconds, teleport between them, and control each world's rules — all from a simple in-game menu. Think “a remote control for an entire multiverse.”

What it actually does

Plain and simple — here's what you get, no setup files to edit:

Make new worlds

Create a fresh world in one click — normal, flat, an empty void, or a ready-made skyblock island. Each gets its own random seed.

Hop between them

Click a world icon to teleport straight to it. Every world shows its type and how many players are inside, right there in the menu.

Rule each world

Flip rules per world — PvP, difficulty, time of day, weather, fly, gamemode, spawn protection — with toggle buttons. No commands needed.

All from one in-game menu

- ◆ **Click to travel** left-click a world to teleport, right-click to see its details.
- ◆ **9 rule switches** keep-inventory, mob spawning, fire, weather... green = on, gray = off.
- ◆ **Safe deletes** removing a world needs an explicit yes/no confirm — no accidents.
- ◆ **Build the menu** create normal, flat, void, or skyblock worlds from the top row.
- ◆ **One-click presets** apply a whole rule set at once: creative-build, adventure, hardcore.
- ◆ **Import old worlds** drop in an existing world folder and register it instantly.

A clever touch ★

Separate backpacks

Each world can keep its own inventory, XP, and health — so your survival gear doesn't follow you into a creative build world.

Remembers everything

Your worlds and their settings survive server restarts, saved automatically. Set it once and it stays that way.

Why it's genuinely handy

Most servers can only run one world at a time, and switching or managing them means fiddling with config files and restarts. KawaiiWorlds wraps all of that — world creation, teleporting, per-world rules, separate inventories, and safe deletion — into one friendly point-and-click menu inside the game. It turns an admin chore into something anyone can do in seconds, without ever touching a single line of text.
